

Thomas Project – Detailed view (v1)

By Bill Weis

Thomas - ALS

Requirements:

1. Be able to voice control his TV through the Tobii device
2. Be able to control his lights

Solution – High Level:

1. We provided Thomas with an Amazon Fire TV cube to control the TV
2. We provided Thomas with some Lix bulbs for this ceiling fixture

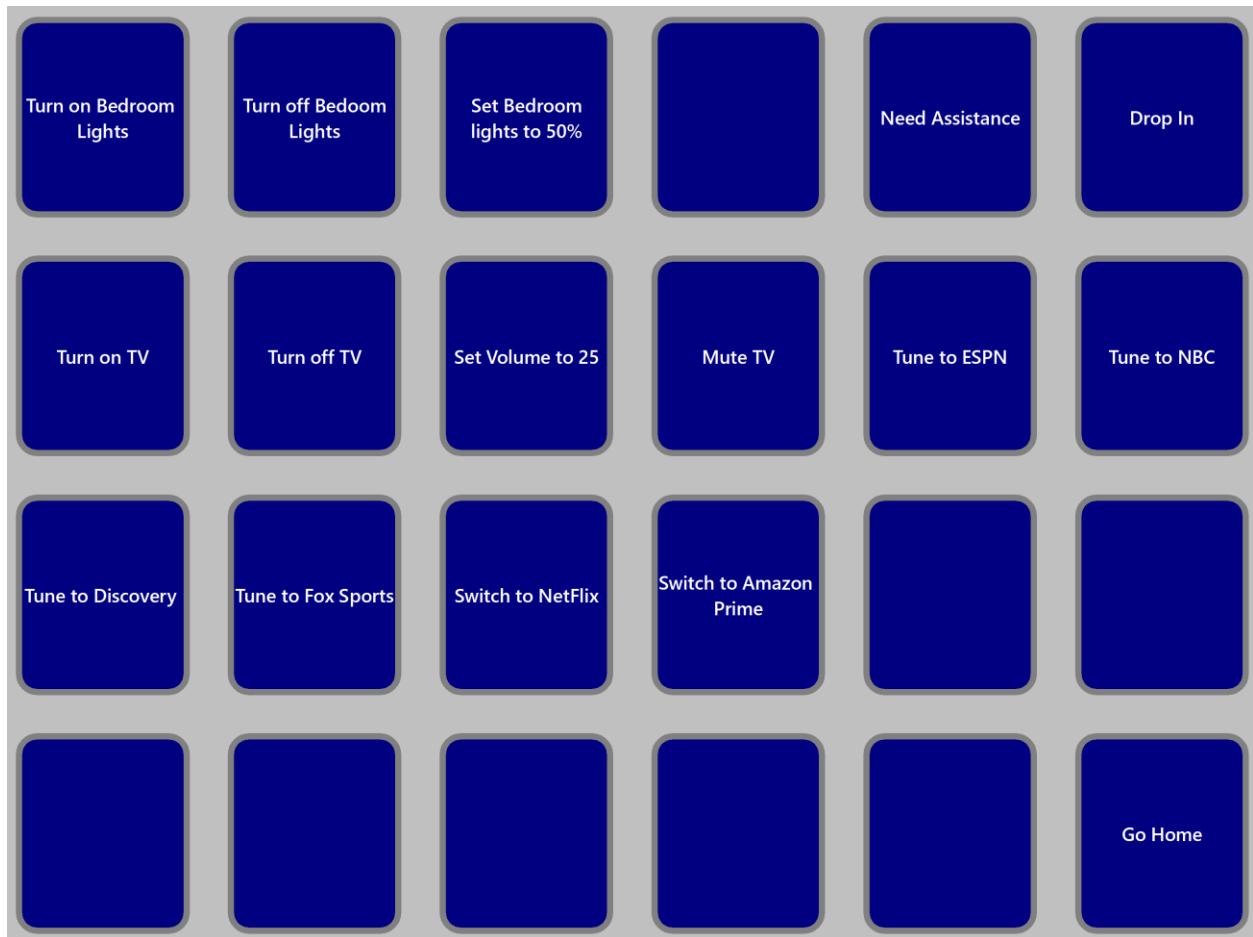

Details of the Solution

1 - Be able to voice control his TV through the Tobii device – Thomas lost his voice from complications associated with ALS. He wanted the independence of being able to control the TV in his room. We provided an Amazon Fire TV cube so Thomas can use the Tobii device to speak the verbal commands which the Amazon Fire TV cube then responds to.

2 - Be able to control his lights – Thomas also wanted to be able to turn the lights on and off in his room. We provided a couple of Lix bulbs for his ceiling fixture which he also controls using the Tobii device.

Using the Tobii to utter the voice commands also gives us the option of creating a custom page set for the commonly used commands.

The following page shows an example of a custom page set for the lights and TV
